|                  | 8   |          | 1X03_SMALL         | JP8, JP9, JP10, JP11, JP12, JP13, JP14, JP15 |                                                       |
|                  | 2   |          | 2*5 (shrouded)     | J1, J2                                       |                                                       |

## Versions

v1.2: first release.

## Assembly

Putting the board together is simple. As usual, start with the flattest components and work your way up.

### Resistors

- four 30k resistors marked in pink
- remainder are 49k9
- for best results, match R1/R2, R7/R8 (and so on), and R4/R5/R6, R10/R11/R12 (and so on).
- the value is less important than the minimum deviation.

## Capacitors

- four 10p as marked in pink
- electrolytics in yellow
- blue are optional (i.e. probably unnecessary)
- remainder are 100n.

## Power

- J2 is a standard Eurorack header
- red = -12V
- blue = +12V
- green = 0V(ground)
- for Core power, bridge the solder jumper marked in yellow
- otherwise install the Vreg circuit in pink
- **IMPORTANT** only choose one of these 3v3 power options! Don't install the regulator if the solder jumper is bridged.

## Headers

For connection to a [Control Board](#), use pin headers placed on the opposite side as the rest of the components i.e. follow the silkscreen markings. For standalone use, you probably want header pins (or sockets, or even bare wires if you wish) on the same side as the remaining circuitry.

## Standalone use

For simplest results, use the complementary [Control Board](#). Otherwise see below for header functions.

### Five pin header

- IN = CV input
- for scaling bipolar CVs, connect or switch into OFFSET (e.g. +5V; n.b. the offset should be

referenced to the common 0V)

- for 0-5V operation, leave SWITCH open; for 0-10V operation, jumper or switch in COMMON to POLE

### Three pin header

- with a 100k pot facing you, solder the left leg to 0V(ground)
- centre to WIPER
- right to LEG
- WIPER and LEG may be jumpered if pots aren't desired, but it is quite useful to have an attenuator to trim down variable CVs or even clip the second op amp for crunchy waveforms!

### Interconnection to Core

J1 carries the scaled CV to J5A or J5B of an STM32F4 Core module.
